Question Label : Multiple Select Question

Choose the set of correct options.

Options :

6406531285050. ✖ If there is a square matrix A such that $A^2 + A = 0$, then $det(A)$ must be either 0 or -1.

6406531285051. ✔ If u is a solution of the system of linear equations $Ax = c$ and c is a solution of the system of linear equations $Ax = b$, then u is a solution of the system of linear equations $A^2x = b$.

6406531285052. ✖ If B is a diagonal matrix of order 3, then $AB - BA = 0$ for all square matrices A of order 3.

6406531285053. ✔ If there is an invertible real 3×3 matrix A such that $A\,adj(A) = 3I$, then $det(adj(A))$ must be 9.

Question Label : Short Answer Question

If addition and scalar multiplication on $V = \mathbb{R}^2$ is defined as follows:

$$\textit{Addition: } (x_1, y_1) + (x_2, y_2) = (0, 0); \quad (x_1, y_1), (x_2, y_2) \in V$$

$$\textit{Scalar multiplication: } c(x, y) = (0, 0);\ (x, y) \in V,\ c \in \mathbb{R}$$

Consider the following statements.

1. There exists an element 0 (called the zero vector of V) in V such that $0 + v = v,\ \forall\, v \in V$.
2. For each vector of $v \in V$ and for each pair $a, b \in \mathbb{R}, (a + b)v = av + bv$.
3. For each vector of $a \in \mathbb{R}$ and for each pair $v_1, v_2 \in V, a(v_1 + v_2) = av_1 + av_2$.
4. For each vector of $v \in V$ and for each pair $a, b \in \mathbb{R}, (ab)v = a(bv)$.

Which of the above statements is not true with respect to the addition and scalar multiplication on $V = \mathbb{R}^2$ defined above? (Enter the serial number of the statement which is not true. If statement 2 is incorrect, then enter 2 as your answer.)

Correct Marks : 2

Question Label : Short Answer Question

Consider the following two statements:

P: $V = \mathbb{R}^2$, with the operations:

Addition:

$$(x_1, y_1) + (x_2, y_2) = (x_1 x_2, y_1 y_2);\ (x_1, y_1), (x_2, y_2) \in V$$

and

Scalar multiplication:

$$c(x, y) = (cx, cy);\ (x, y) \in V,\ c \in \mathbb{R}$$

is a vector space.

Q: Let V be a vector space. If $u, v, w \in V$ are such that $au + bv + cw = 0$ for some scalars $a, b, c \in \mathbb{R}$ and $ac \neq 0$, then $\text{span}\{u, v\} = \text{span}\{v, w\}$.

Consider the following statements:

- **Statement 1:** P is true, but Q is false.
- **Statement 2:** Q is true, but P is false.
- **Statement 3:** Both P and Q are true.
- **Statement 4:** Both P and Q are false.

Which one of the above statements is correct? (e.g. if Statement 1 is correct, then enter 1 as your answer).

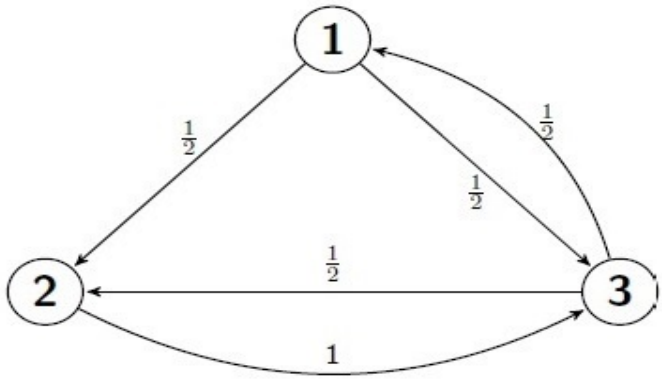
Question Numbers : (14 to 16)

Question Label : Comprehension

A system can be in one of 3 possible states at a given time. At the next instant, it changes its state as represented pictorially in the diagram below. The number beside an arrow shows the transition probabilities from the beginning state of the arrow to the ending state of the arrow (e.g. in the diagram M2Q1:1, you can see that there is an arrow starting at state 1 and ending at state 2, with the number $\frac{1}{2}$ beside the arrow. It implies that the probability of transition from state 1 to state 2 is $\frac{1}{2}$). No arrow from state 2 to state 1 indicates that direct transition is not possible (equivalently the transition probability is 0). The probability of transition from a state to itself is 0.



M2Q1:1

The information in the diagram is represented by the matrix

$P = \begin{bmatrix} 0 & \frac{1}{2} & \frac{1}{2} \\ 0 & 0 & 1 \\ \frac{1}{2} & \frac{1}{2} & 0 \end{bmatrix}$, where the ij-th entry of P denotes the probability of transition from state i to state j. Let the probabilities that the system is in State 1, State 2 or State 3 initially (i.e., at $t = 0$) be X_0^1, X_0^2, and X_0^3, respectively. This is represented by the initial distribution vector (3×1 matrix) and is denoted by $X_0 = \begin{bmatrix} X_0^1 \\ X_0^2 \\ X_0^3 \end{bmatrix}$.

For any positive integer n, the distribution vector at $t = n$ is denoted by X_n and is given by the equation $P^T X_{n-1} = X_n$.

Answer the given subquestions from the given information.

The following pseudocode is executed using the “Scores” dataset. At the end of the execution, **A** captures the number of students who are male from Bengaluru or have scored less marks in Physics than the average Physics marks. Assume that the variable **Avg** holds the value of the average Physics marks. But the pseudocode may have mistakes. Identify all such mistakes (if any). Assume that all statements not listed in the options below are free of errors.

It is a Multiple Select Question (MSQ).

```
1  A = 0
2  while(Table 1 has more rows){
3      Read the first row X in Table 1
4      C = False, D = False
5      if(X.Gender == 'M' or X.CityTown == "Bengaluru"){
6          C = True
7      }
8      if(X.Physics > Avg){
9          D = True
10     }
11     if(C or D){
12         A = A + 1
13     }
14     Move X to Table 2
15 }
```

Question Label : Multiple Select Question

Select all snippets of code that print the following sequence of **n** lines, where **n** is a positive integer that is already defined. The i^{th} line in the output corresponds to the first **i** Fibonacci numbers, for $1 \leq i \leq n$. Assume that 0 and 1 are the first two Fibonacci numbers. There should be a single space after every number. Specifically, there should be a single space after the last number in any given line.

Sample output for n = 7

```
0
0 1
0 1 1
0 1 1 2
0 1 1 2 3
0 1 1 2 3 5
0 1 1 2 3 5 8
```

Options :

```
L = [0, 1]
for i in range(n - 2):
    L.append(L[-1] + L[-2])
for i in range(1, n + 1):
    for j in range(i):
        print(L[j], end = ' ')
    print()
```

6406531285234. ✔

```
i = 0
L = []
while i < n:
    if i == 0:
        L.append(0)
    elif i == 1:
        L.append(1)
    else:
        L.append(L[-1] + L[-2])
    i += 1
    for j in range(i):
        print(L[j], end = ' ')
    print()
```

6406531285235. ✔

6406531285236. ✖

```
i = 0
L = []
while i <= n:
    if i == 0:
        L.append(0)
    elif i == 1:
        L.append(1)
    else:
        L.append(L[-1] + L[-2])
    i += 1
    for j in range(i):
        print(L[j], end = ' ')
    print()
```

```
L = [0, 1]
for i in range(n):
    L.append(L[-1] + L[-2])
for i in range(1, n + 1):
    for j in range(i):
        print(L[j], end = ' ')
    print()
```

Consider the following relations as shown in Table 2 and Table 3

shop_no	name
SH01	Tea stall
SH02	Modern Store
SH03	Balaji Store
SH04	Modern Store

Table 2: **Shop**

shop_no	item_name	price
SH01	Sugar	200
SH01	Tea leaf	500
SH02	Cookies	800
SH02	Namkeen	400
SH03	Mustard oil	700
SH04	Cookies	500

Table 3: **Shop_order**

```
SELECT name,AVG(price)
FROM Shop
NATURAL JOIN
Shop_order
GROUP BY name
HAVING AVG(price)>400
```

The number of tuples returned by the above SQL query.

Consider a list `L` of tuples `[(7, 8, 1), (3, 7, 5), (7, 9, 5), (6, 9, 5), (7, 6, 1), (9, 9, 0)]`. The following `sort` function is executed on the list `L`.

```
1  def sort(L):
2      n = len(L)
3      if n < 1:
4          return(L)
5      for i in range(n):
6          j = i
7          while(j > 0 and L[j][2] < L[j-1][2]):
8              (L[j],L[j-1]) = (L[j-1],L[j])
9              j = j - 1
10     return(L)
```

Which of the following list is returned by the function `sort(L)`?

Options :

6406531285309. ✖ `[(9, 9, 0), (7, 8, 1), (7, 6, 1), (6, 9, 5), (3, 7, 5), (7, 9, 5)]`

6406531285310. ✖ `[(9, 9, 0), (7, 6, 1), (7, 8, 1), (6, 9, 5), (3, 7, 5), (7, 9, 5)]`

6406531285311. ✖ `[(9, 9, 0), (7, 6, 1), (7, 8, 1), (3, 7, 5), (6, 9, 5), (7, 9, 5)]`

6406531285312. ✔ `[(9, 9, 0), (7, 8, 1), (7, 6, 1), (3, 7, 5), (7, 9, 5), (6, 9, 5)]`

Question Label : Multiple Choice Question

Consider a list `L` of `n` sorted numbers that are circularly shifted `k` positions to the right.

For example, `[-1,0,3,4,9,12]` is a sorted list.

`[9,12,-1,0,3,4]` : circularly shifted `2` positions to the right.

`[3,4,9,12,-1,0]` : circularly shifted `4` positions to the right.

What will be the complexity of the **most efficient algorithm** to search for the smallest element in `L` for the two cases listed below?

I. Value of `k` is not known.

II. Value of `k` is known.

Options :

6406531285317. ✖ I. $O(n)$, II. $O(1)$

6406531285318. ✖ I. $O(\log n)$, II. $O(\log n)$

6406531285319. ✖ I. $O(n)$, II. $O(\log n)$

6406531285320. ✔ I. $O(\log n)$, II. $O(1)$

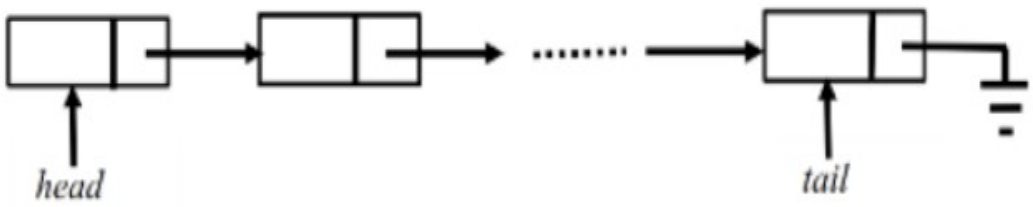
```
class Node:
    def __init__(self,data):
        self.data = data
        self.next = None
```

Consider an implementation of a singly linked list, where each node is created using the given class `Node`. Suppose it has a `head` variable that points to the first node of the linked list and a `tail` variable that points to the last element of the linked list.



Suppose we want to perform the following operations on the given linked list:-

1. Insertion of the new node at the first position of the linked list.
2. Insertion of the new node at the last position of the linked list.
3. Deletion of the first node of the linked list.
4. Deletion of the last node of the linked list.

Which of the above operation can be performed in **constant time** $O(1)$?

Options :

6406531285321. ✖ 1, 2 and 4

6406531285322. ✔ 1, 2 and 3

6406531285323. ✖ 2, 3 and 4

6406531285324. ✖ 1, 2, 3 and 4

A university offers an online learning program in which there are 12 courses in total. The program is divided into **semesters** of 6 months. Students can take any number of courses in one semester, but they can take a course only if they have finished taking its prerequisites.

Course	Prerequisite
Course 1	None
Course 2	None
Course 3	Course 1
Course 4	Course 2
Course 5	None
Course 6	Course 1, Course 3
Course 7	Course 2, Course 4
Course 8	Course 3
Course 9	Course 5, Course 7
Course 10	Course 6, Course 8
Course 11	Course 7
Course 12	Course 4, Course 8

There is no constraint on how many courses a student can take in a semester. The minimum number of **semesters** required to complete all 12 courses is ___.

Consider the code snippets given below.
(Concept: HTML and CSS)

File 1: index.html:

```
<head>
    <link rel="stylesheet" href="style.css">
</head>
<body>
    <h3>The CSS Box Model</h3>
    <div class="my_border box">
        <h3 class="title">Border</h3>
        <div class="my_padding box">
            <h3 class="title">Padding</h3>
            <div class="my_content box">
                <h3 class="title">Content</h3>
            <div>
        <div>
    <div>
</body>
```

File 2: style.css:

```
div.my_border
 {background-color: purple;
  border: 2px dotted grey;
  height: 130px;
  width: 130px;}

div.my_padding
 {background-color: lightblue;
 height: 80px;
 width: 80px;}

div.my_content
 {background-color: yellow;
   height: 40px;
   width: 45px; }

.title
 {text-align: left;
  font-size: 10px;
  font-style: italic;}

.box
{margin: 10px 20px;
    padding: 0px;}
```

What will be rendered by the browser, when the above HTML file is loaded?

Options :

6406531285369. ✔

The CSS Box Model

The CSS Box Model

6406531285370. ✖

Question Label : Multiple Choice Question

Consider the following Python code given below.

(Concept: Flask and concepts of HTTP methods)

```
from flask import Flask, request, url_for

app = Flask(__name__)

@app.route('/dashboard')
def dashboard():
    return 'This is the dashboard'

@app.route('/user/<username>')
def user(username):
    return f'This is {username} profile'

@app.route('/login', methods=['GET', 'POST'])
def login():
    if request.method == 'POST':
        return(url_for('user', username='your_name'))
    else:
        return (url_for('dashboard'))

if __name__ == '__main__':
    app.run(debug=True)
```

If the above flask application is running on URL "http://127.0.0.1:5000", which of the following is the correct output if a user visits the URL "http://127.0.0.1:5000/login", using a browser?

Options :

6406531285373. ✖ This is the dashboard.

6406531285374. ✔ /dashboard

6406531285375. ✖ "404 NOT FOUND" error

6406531285376. ✖ /user/your_name

Question Label : Multiple Choice Question

Consider the following code for flask application.

main.py:

```
from flask import Flask,render_template
app = Flask(__name__)

@app.route('/viewdata/')
def student_list():
    student_data={
        'rollno': [1001,1002,1003,1004,1005],
        'name': ['Amit','Ravi','Karthik','Ankur','Ishan'],
        'course':['Python','MAD1','MAD2','DBMS','MAD2']
    }
    return render_template("viewlist.html",st = student_data)
if __name__ == '__main__':
   app.run()
```

viewlist.html:

```
<!DOCTYPE html>
<html lang="en">

<head>
    <title>Document</title>
    <style>
        table, th, td {
            border: 1px solid black;
        }
    </style>
</head>

<body>
    <table>
        <tr>
            <th>Sno</th>
            <th>Roll No</th>
            <th>Name</th>
            <th>Course</th>
        </tr>

<!-- missing code block -->
    HTML code block
<!-- missing code block -->

    </table>
</body>

</html>
```

Suppose we want to display the `student_data` in the following table format for route "`http://127.0.0.1:5000/viewdata/`":

Sno	Roll No	Name	Course
1	1001	Amit	Python
2	1002	Ravi	MAD1
3	1003	Karthik	MAD2
4	1004	Ankur	DBMS
5	1005	Ishan	MAD2

Select the correct option to fill at the place of **HTML code block** in `viewlist.html` file to display the data in the above given table format without any error?

Options :

6406531285402. ✖

```
{for i in range(st['rollno']|length)}
<tr>
    <td>{{i+1}}</td>
    <td>{{st['rollno'][i]}}</td>

The ML team in a movie production company wanted to predict whether a movie will earn 100 cr or not by using some classification models. Therefore, the team collected presence/absence of various factors $\mathbf{x} = [x_1, x_2, x_3]$ from the movies in the past. The data and the corresponding labels are shown in the Table below.

x	y
[0,1,1]	0
[1,0,1]	1
[1,0,0]	1
[1,1,1]	1
[1,1,0]	1

Compute the loss of the model if they use

$$u(z) = \begin{cases} 1, & \text{if } z \geq 0 \\ 0, & \text{otherwise} \end{cases}$$

and $z = 0.5x_1 - 0.8x_2 + 0.4x_3$

Correct Marks : 3

Question Label : Multiple Choice Question

Consider the Java code given below.

```
interface Readable{
  public default void read(){
    System.out.println("Reads");
  }
}
interface Writable{
  public default void write(){
    System.out.println("Writes");
  }
}
class Document implements Readable, Writable{
  public void read(){
    System.out.println("Reads the lines in doc");
  }
}
public class Test {
  public static void main(String[] args) {
    Readable r1 = new Document();
    r1.read();
    r1.write();
  }

}
```

Choose the correct option

Options :

6406531285454. ✖ This program generates the output:

```
Reads the lines in doc
Writes
```

6406531285455. ✖

This program generates the output:

```
Reads
Writes
```

6406531285456. ✖ This program generates compiler error because neither is class `Document` declared as abstract nor does it override method `write( )`.

6406531285457. ✔ This program generates compiler error because `r1` of type `Readable` cannot invoke method `write( )`.

Question Number : 134 Question Id : 640653386516 Question Type : MCQ Is Question Mandatory : No Calculator : None Response Time : N.A Think Time : N.A Minimum Instruction Time : 0

Correct Marks : 3

Question Label : Multiple Choice Question

Consider the Java code given below.

```
interface Iterator{
  public boolean has_next();
  public Object get_next();
}
class Faculty{
  // ...
  private class FacIter implements Iterator{
    // ....
    public boolean has_next() {
      // ...
      return false;
    }
    public Object get_next() {
      // ...
    }
  }
  public Iterator getIterator() {
      return new FacIter();
  }
}
public class Test{
    public static void main(String[] args) {
        Faculty fList = new Faculty();
        //CODE BLOCK                          // LINE-1
        boolean hasNext = iter.has_next();    // LINE-2
    }
}
```

Identify the appropriate statements to fill in place of LINE-1 in order to correctly invoke method has_next() as given in LINE-2.

Options :

6406531285466. ✖ `Iterator iter = new FacIter();`

6406531285467. ✔ `Iterator iter = fList.getIterator();`

6406531285468. ✖ `FacIter iter = fList.getIterator();`

6406531285469. ✖ Method has_next() cannot be invoked from an outside class.

Question Number : 135 Question Id : 640653386517 Question Type : MCQ Is Question Mandatory : No Calculator : None Response Time : N.A Think Time : N.A Minimum Instruction Time : 0

Correct Marks : 3

Question Label : Multiple Choice Question

Consider the Java code given below.

```
class Experiment{
  public void begin(){
    Simulation s = new Simulation(this); // LINE 1
    s.simulate();
    System.out.println("Experiment finished");
  }
  public void alarm(){
    System.out.println("Collected results");
  }
}
class Simulation{
  Experiment exp;
  public Simulation(Experiment e){
    exp = e;
  }
  public void simulate(){
    System.out.println("Simulated Successfully");
    exp.alarm(); // LINE 2
  }
}
public class Test {
  public static void main(String[] args) {
    Experiment e1 = new Experiment();
    e1.begin();
  }
}
```

Choose the correct option.

Options :

6406531285470. ✖ This program generates compiler error at LINE 1
Reason: An object of Simulation cannot be created inside method begin because it uses an object of Experiment in its constructor.

6406531285471. ✔

This program generates the output:

```
Simulated Successfully
Collected results
Experiment finished
```

6406531285472. ✖

This program generates the output:

`Simulated Successfully`

followed by runtime error

Reason: A method inside class `Experiment` is invoking method `simulate` inside class `Simulation`, whereas `simulate` is invoking another method in class `Experiment`.

6406531285473. ✖

This program generates compiler error at `LINE 2`

Reason: A method inside class `Experiment` is invoking method `simulate` inside class `Simulation`, whereas `simulate` is invoking another method in class `Experiment`.

Question Label : Multiple Choice Question

Consider the Java code given below.

```
interface Taxable{
    public default void tax(){
        System.out.println("no tax");
    }
}
class LowerScalePay implements Taxable{          //LINE 1
    // No tax
}
class HigherScalePay implements Taxable{
    public void tax() {
        System.out.println("tax: 10000");
    }
}
public class Test{
    public static void main(String[] args) {
        Taxable t1 = new LowerScalePay();
        t1.tax();                                 // LINE 2
        Taxable t2 = new HigherScalePay();
        t2.tax();
    }
}
```

Choose the correct option.

Options :

6406531285478. ✖ Compiler error at `LINE 1` because class `LowerScalePay` is not abstract

6406531285479. ✖ This program generates output:

```
no tax
no tax
```

6406531285480. ✖ Runtime error because method `tax()` is not defined for class `LowerScalePay` (see `LINE 2`)

6406531285481. ✔ This program generates output:

```
no tax
tax: 10000
```

Question Number : 137 Question Id : 640653386521 Question Type : MCQ Is Question Mandatory : No Calculator : None Response Time : N.A Think Time : N.A Minimum Instruction Time : 0

Question Label : Multiple Choice Question

Consider the Java code given below.

```
class Faculty{
    private String name;
    private double salary;
    public Faculty(String n, double s) {
        name = n;
        salary = s;
    }
    public String toString() {
        return "name = " + name + ", salary = " + salary;
    }
}
class HOD extends Faculty{
    String classTeacher;
    public HOD(String ct) {
        //LINE-1
    }
    public HOD(String n, double s, String ct) {
        //LINE-2
        classTeacher = ct;
    }
    public String toString() {
        return super.toString()+", classTeacher = "+classTeacher;
    }
}
public class ConTest {
    public static void main(String[] args) {
        Faculty obj = new HOD("XYZ");
        System.out.println(obj);
    }
}
```

Choose the correct option to fill in place of LINE-1 and LINE-2 so that the output is:

```
name = ABC, salary = 5000.0, classTeacher = XYZ
```

Options :

6406531285486. ✖

```
LINE-1 :  super("ABC", 5000.00, ct);
LINE-2 :  this(n, s);
```

6406531285487. ✔
```
LINE-1 :  this("ABC", 5000.00, ct);
LINE-2 :  super(n, s);
```

Question Label : Multiple Choice Question

Consider the Java code given below.

```
class Student{
  String name;
  int[] marks;

  public Student(String n, int[] m){
    name = n;
    marks = m;
  }
  public Student(Student s){
    this.name = s.name;
    this.marks = s.marks;
  }
}
public class Test{
  public static void main(String[] args){
    int[] m  = {90, 70, 60};
    Student s1 = new Student("reena", m);
    Student s2 = new Student(s1);
    s2.name= "madhu";
    s2.marks[0] = 79;
    System.out.println(s1.name + "," +s1.marks[0]);
    System.out.println(s2.name + "," +s2.marks[0]);
  }
}
```

What will the output be?

Options :

6406531285510. ✖ It generates output:
madhu,79
madhu,79

6406531285511. ✔ It generates output:
reena,79
madhu,79

6406531285512. ✖ It generates output:
reena,90
madhu,79

6406531285513. ✖ It generates output:
madhu,90
madhu,79

Consider the Java code given below.

```
interface Summable{
  public Object twoSum(Object o1);
}
abstract class Printable implements Summable{
  public abstract void print();
}
class Point extends Printable{
  double x, y;
  public Point(){
  }
  public Point(double n1, double n2){
    x = n1;
    y = n2;
  }
  // ------- CODE BLOCK -------
  public void print(){
    System.out.println(x+","+ y);
  }
}
public class Test{
  public static void main(String[] args){
    Point p = new Point();
    Point p1 = new Point(2, 3);
    Point p2 = new Point(2, 3);
    p = p1.twoSum(p2);
    p.print();
  }
}
```

Identify the correct option to be filled in place of CODE BLOCK to generate the output
4.0,6.0

Options :

```
public Object twoSum(Point p1){
    Point p = new Point(this.x, this.y);
    p.x = p.x + p1.x;
    p.y = p.y + p1.y;
    return p;
}
```

If the rank of an applicant is < 10000, the following Java program should print Seat allotted. Otherwise, it should print Seat cannot be allotted.

```
interface Enquiry{
  public void printAvailability();
}
class Admission{
  // ...
  public Enquiry checkDetails(){
    // ...
    if(rank < 10000)
      return new PassedEnquiry();
    return new FailedEnquiry();
  }
  private class PassedEnquiry implements Enquiry{
    public void printAvailability(){
        System.out.println("Seat allotted");
    }
  }
  private class FailedEnquiry implements Enquiry{
    public void printAvailability(){
        System.out.println("Seat cannot be allotted");
    }
  }
}
public class Test {
  public static void main(String[] args) {
    Admission a1 = new Admission(100);          //rank of a1 is 100
    Admission a2 = new Admission(12000);        //rank of a2 is 12000
    // LINE 1
  }
}
```

Identify the correct statement to fill in the blank at LINE-1, such that the output is:
Seat cannot be allotted

Options :

6406531285474. ✔ `a2.checkDetails().printAvailability();`

6406531285475. ✖ `a2.printAvailability();`

6406531285476. ✖ `a1.printAvailability();`

6406531285477. ✖ `a1.checkDetails().printAvailability();`

Question Label : Multiple Select Question

Consider the Java code given below.

```
class Principal{
    private String name;
    private int age;
    public Principal(String n, int a) {
        name = n;
        age = a;
    }
    public String toString() {
        return "name = " + name + ", age = " + age;
    }
}
class Director extends Principal{
    private String rules;
    public void setRules(String r) {
        rules = r;
    }
    public Director(String n, int a) {
        super(n, a);
    }
    public String toString() {
        return super.toString()+", rules = " + rules;
    }
}
class Founder extends Director{
    private String resources;
    public void setResources(String r) {
        resources = r;
    }
    public Founder(String n, int a) {
        super(n, a);
    }
    public String toString() {
        return super.toString()+", resources = " + resources ;
    }
}
public class DynamicTest {
    public static void main(String[] args) {
        //CODE BLOCK
        ((Director)obj1).setRules("Rule 1");
        ((Founder)obj2).setRules("Rule 2");
        ((Founder)obj2).setResources("Resource 1");

          System.out.println(obj1);
          System.out.println(obj2);
      }
  }
```

Choose the correct option(s) to fill in place of `CODE BLOCK` so that the output is:

```
name = Shahin, age = 43, rules = Rule 1
name = Harideep, age = 47, rules = Rule 2, resources = Resource 1
```

Options :

6406531285482. ✔
```
Principal obj1 = new Director("Shahin", 43);
Principal obj2 = new Founder("Harideep", 47);
```

6406531285483. ✖
```
Director obj1 = new Principal("Shahin", 43);
Founder obj2 = new Director("Harideep", 47);
```

6406531285484. ✔
```
Principal obj1 = new Director("Shahin", 43);
Director obj2 = new Founder("Harideep", 47);
```

6406531285485. ✖
```
Director obj1 = new Principal("Shahin", 43);
Founder obj2 = new Principal("Harideep", 47);
```

Question Label : Multiple Choice Question

Consider the following Vue application with markup “index.html” and javascript file “app.js”.

index.html:

```
<body>
    <div id="app">
      <h3 id="total">Total: {{total}}</h3>
      <h4 id="strike">{{batsmans.strike.name}}: {{batsmans.strike.run}}</h4>
      <h4 id="non-strike">{{batsmans.nonStrike.name}}:
{{batsmans.nonStrike.run}}</h4>
      <div>
        <button @click="total+=1">1</button>
        <button @click="total+=2">2</button>
      </div>
    </div>
    <script
src="https://cdn.jsdelivr.net/npm/vue@2.7.8/dist/vue.js"></script>
    <script src="app.js"></script>
  </body>
```

app.js:

```
class Player {
  constructor(name) {
    this.name = name
    this.run = 0
  }
}

new Vue({
  el: '#app',
  data: {
    batsmans: {
      strike: new Player('Rohit Sharma'),
      nonStrike: new Player('Virat Kohli'),
    },
    total: 30,
  },
  watch: {
    total(newRun, oldRun) {
      change = newRun - oldRun
      this.batsmans.strike.run += change
      if (change % 2 == 0) {
        this.changeStrike()
      }
    },
  },
  methods: {
    changeStrike() {
      temp = this.batsmans.strike
      this.batsmans.strike = this.batsmans.nonStrike
      this.batsmans.nonStrike = temp
    },
  },
})
```

If the user clicks on the button with the text “2” twice and “1” once. What will be rendered inside the element with ID “total”, “strike”, and “non-strike”?

Options :

6406531285572. ✖ Total: 5, Virat Kohli: 0, Rohit Sharma: 5

Consider the following Vue application with markup “index.html” and javascript file “app.js”.

index.html:

```
<html lang="en">
  <head>
    <style>
      .sold {
        color: red;
      }
    </style>
  </head>
  <body>
     <div id="app">
      <Product
        v-for="(product, index) in products"
        :product="product"
        @buy="buy"
        :key="index"
      />
    </div>
    <script
src="https://cdn.jsdelivr.net/npm/vue@2.7.8/dist/vue.js"></script>
    <script src="app.js"></script>
  </body>
</html>
```

app.js:

```
const Product = {
  template: `<div :class="{sold:product.sold}">
    <h4>{{product.name}}</h4>
    <h3>Price:{{product.price}}</h3>
    <div><button @click="$emit('buy', product.id)"> Buy </button></div>
    </div>`,
  props: ['product'],
}

new Vue({
  el: '#app',
  components: { Product },
  data() {
    return {
      products: [
        { id: 1, name: 'Watch', price: '200', sold: true },
        { id: 2, name: 'Mobile', price: '4000', sold: true },
      ],
    }
  },
  methods: {
    buy(id) {
      prod = this.products.find((prod) => {
        return prod.id == id
      })
      prod.sold = false
    },
  },
})
```

If the user clicks on the button with the text “Buy” corresponding to the product having ID “1”. What will be the text colour of the rendered “Product” component, corresponding to the product having ID “1” and “2”, respectively?

Question Label : Short Answer Question

Consider a centered dataset of 1000 points in $\mathbb{R}^{10}$. Standard PCA is performed on this dataset. What is the maximum number of principal components that can be retained so that the compression ratio does not fall below 1.4 ? The compression ratio is defined as:

$$\frac{\text{size of original dataset}}{\text{size of reconstructed dataset}}$$

Assume that each real number occupies one unit of storage space. Note that we are interested in the reconstructions and not just in the scalar projections. So, the reconstructed dataset will also be in $\mathbb{R}^{10}$.

Question Numbers : (185 to 186)

Question Label : Comprehension

Assume that you have a dataset of four points $\{x_1, x_2, x_3, x_4\}$, all of which lie in $[0, 1]$. You hypothesise that the data points are iid random variables with the following density:

$$f(x;\theta) = \begin{cases} \theta x^{\theta-1}, & 0 \leq x \leq 1 \\ 0, & \text{otherwise} \end{cases}$$

Based on the above data, answer the given subquestions.

Sub questions

Question Number : 185 Question Id : 640653386568 Question Type : MCQ Is Question Mandatory : No Calculator : None Response Time : N.A Think Time : N.A Minimum Instruction Time : 0

Correct Marks : 5

Question Label : Multiple Choice Question

What is the log-likelihood of this dataset under this distribution?

Options :

6406531285624. ✖ $\prod_{i=1}^{4} \theta x_i^{\theta-1}$

6406531285625. ✖ $\sum_{i=1}^{4} \theta x_i^{\theta-1}$

6406531285626. ✔ $\sum_{i=1}^{4} [\log \theta + (\theta - 1) \log x_i]$

6406531285627. ✖ $\prod_{i=1}^{4} [\log \theta + (\theta - 1) \log x_i]$

Question Number : 186 Question Id : 640653386569 Question Type : SA Calculator : None

Response Time : N.A Think Time : N.A Minimum Instruction Time : 0

Correct Marks : 5

Question Label : Short Answer Question

You are given the actual values of these observations:

$$x_1 = \frac{1}{e}, \quad x_2 = \frac{1}{e^2}, \quad x_3 = \frac{1}{e^3}, \quad x_4 = \frac{1}{e^4}$$

What is the maximum likelihood estimate for θ? Use $\log_e$ wherever appropriate.

Hint: Differentiate the log-likelihood with respect to θ and set it to zero.

Consider this hypothetical example: *Coca-Cola decreased the price of 300 ml Diet Coke can from INR 40 per can to INR 38. This resulted in consumers buying 7000 cans a week. Before the price drop, consumers bought only 5000 cans a week. In the same week, Pepsi reduced the price of its Black cans by INR 2, which increased the sales of Pepsi Black by a whopping 25%! To add to all the complexity, in the same week, the price of petrol increased by 3%, and that of diesel by 2.5%, resulting in a net decrease in fuel usage by 0.02%*. Given all this data, calculate the price elasticity of demand of Diet Coke (round the answer to 2 decimal places).

What will be the result of the keystrokes `$jddk0dw` on vi editor or `<C-e><C-k><C-k><C-a><M-d><C-d>` on emacs editor from first line first character on the text given below. `<C-x>` and `<M-x>` refers to Control + x and Meta/Alt + x respectively.

```
abcd efgh ijkl
mnop qrst uvw
xyz
```

Hint:
Emacs:
- `<C-k>` delete the entire line (from the cursor to the end)
- `<M-d>` delete word
- `<C-d>` delete character

Vi:
- `dd` delete the entire line
- `dw` delete word

Options :

6406531285852. ✖

```
abcd efgh
xyz
```

6406531285853. ✖

```

In an organization a particular software requires a key file. The key file will change at 6 am and 6 pm. The command `generate-key` will generate the key file with either of the option `--day` or `--night` with respect to the time at which the command is executed. Choose the command that does the above job.

Hint:
The output of date command with and without the option are shown below.

```
$ date +%H:%M
15:06

$ date
Monday 19 September 2022 03:06:44 PM IST
```

Options :

6406531285832. ✔

```
[[ $(date +%H:%M) > 06:00 && $(date +%H:%M) < 18:00 ]] &&
        generate-key --day ||
        generate-key --night
```

6406531285833. ✖

```
[[ $(date) > 06:00 || $(date) < 18:00 ]] &&
        generate-key --day ||
        generate-key --night
```

6406531285834. ✖

```
[[ $(date +%H:%M) > 06:00 && $(date +%H:%M) < 18:00 ]] &&
        generate-key --night ||
        generate-key --day
```

6406531285835. ✖

```
[[ $(date +%H:%M) -gt 06:00 && $(date +%H:%M) -lt 18:00 ]] &&
        generate-key --day ||
        generate-key --night
```
